1 INTRODUCTION

Migraine is a common neurological disorder among university students and negatively affects physical and mental well being, daily functioning and academic performance (Alatawi et al., 2023).

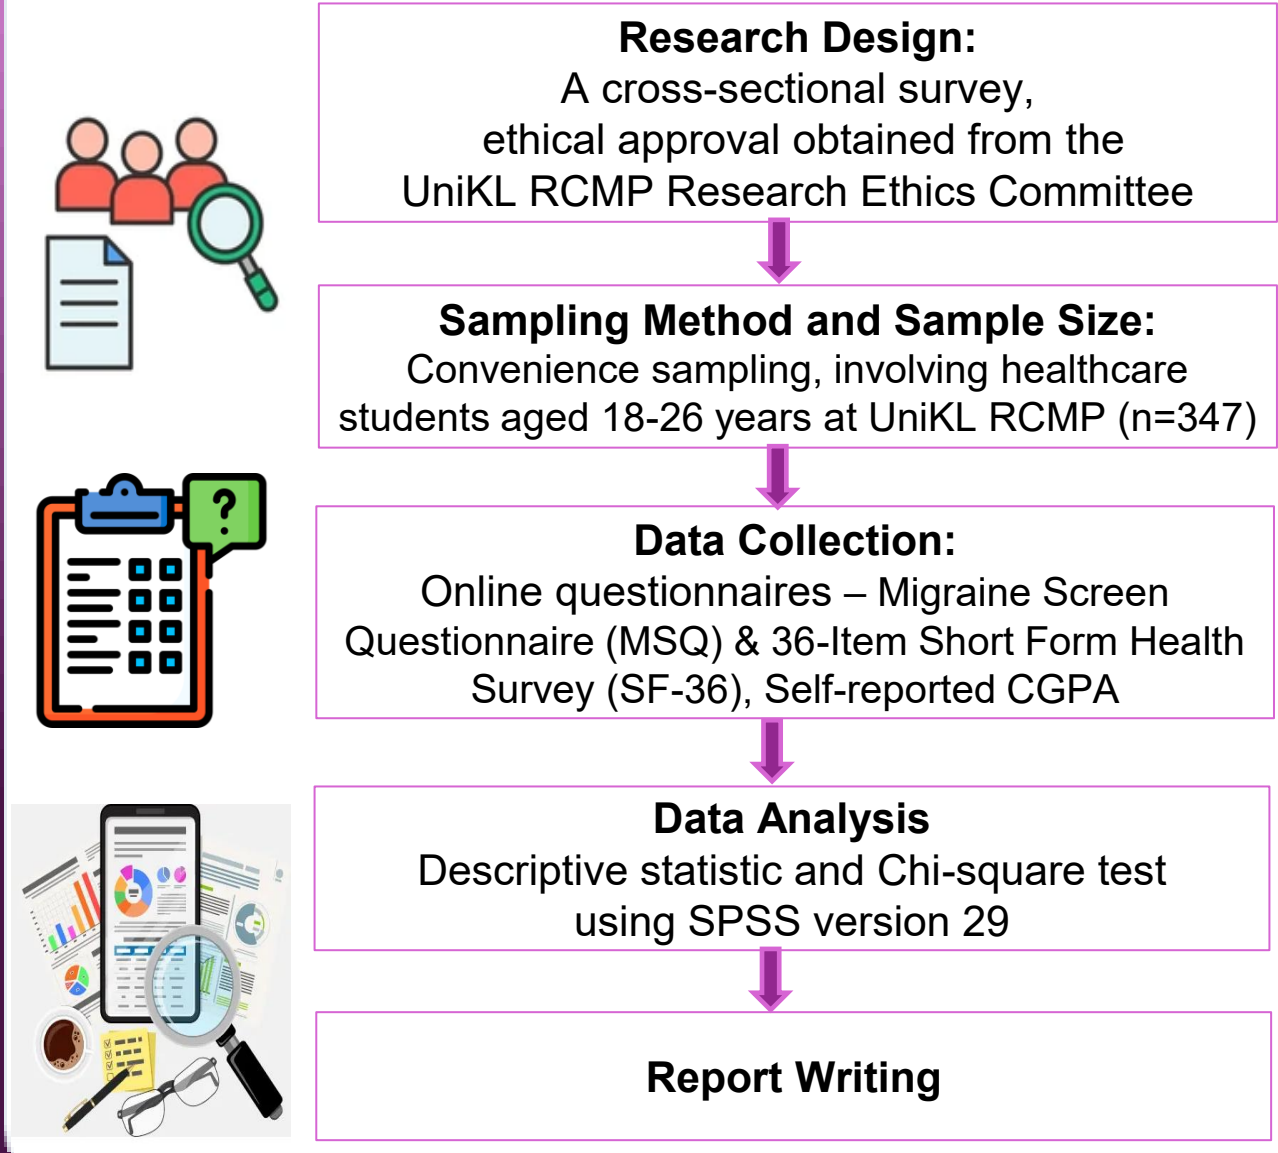

Healthcare students may be particularly affected due to demanding academic schedules and study-related stress. Previous studies have reported substantial migraine burden among medical and healthcare students (Thiagarajan et al., 2022; Romozzi et al., 2024).

Despite its potential impact, institution-specific evidence on the prevalence of migraine and its relationship with both quality of life and academic performance among Malaysian healthcare students remains limited, emphasizing the need for early identification and intervention (Thiagarajan et al., 2022).

Objectives:

- RO1 To identify the prevalence of migraine among healthcare students at UniKL RCMP.
- RO2 To determine the association between migraine, quality of life and academic performance among healthcare students at UniKL RCMP.

2 METHODOLOGY

5 CONCLUSION

Migraine is prevalent among healthcare students and is significantly associated with reduced physical and mental quality of life as well as poorer academic performance. These findings highlight the importance of early screening, targeted intervention and institutional support to promote student well-being, contributing to SDG 3 (Good Health and Well-Being).

6 ACKNOWLEDGEMENT

Universiti Kuala Lumpur Royal College of Medicine Perak and all participants involved in this study.

7 DECLARATION OF CONFLICT FOR ALL AUTHORS

The authors declare that they have no conflict of interest.

3 RESULTS

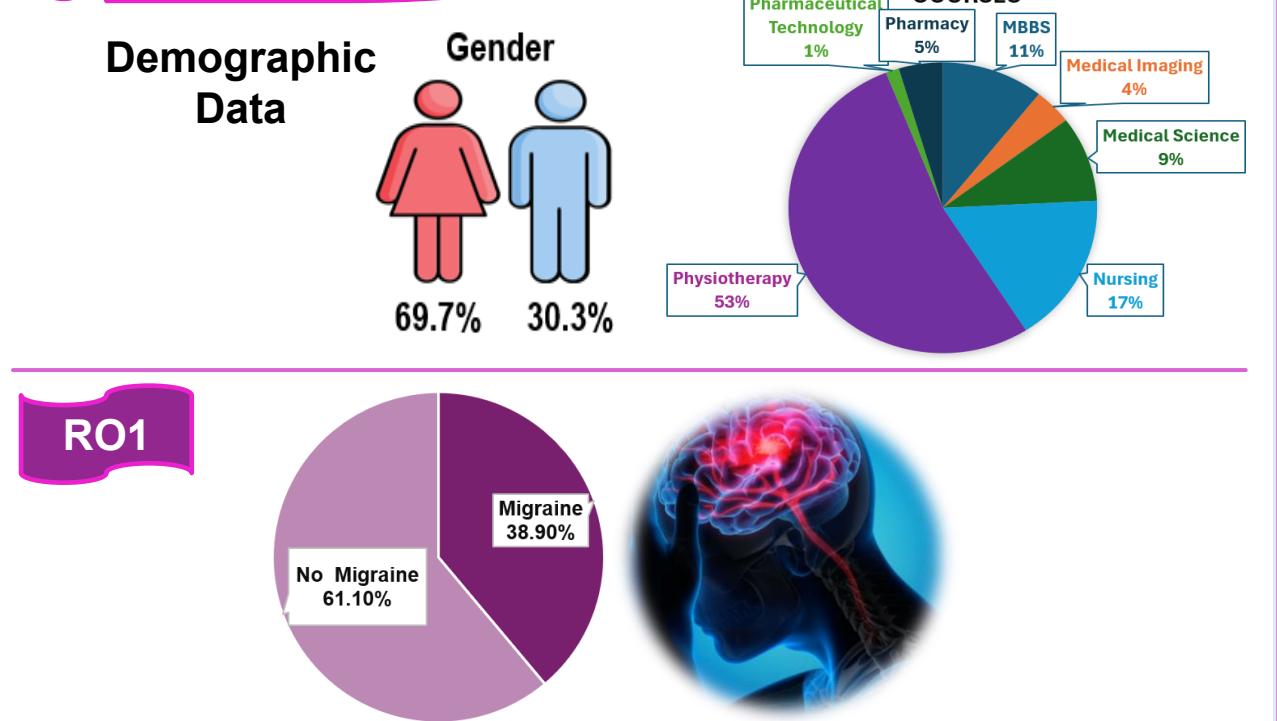

Figure 1: Prevalence of migraine among healthcare students (n=347)

RO2

Table 1: Association between migraine, quality of life and academic performance (n=347)

Variables		No migraine n (%)	Migraine n (%)	χ ² (df)	P-value
Quality of life: Physical Component Summary (PCS)	Poor PCS (0–49)	181 (67.0%)	89 (33.0%)	18.07 (1)	<0.001**
	Good PCS (50–100)	31 (40.3%)	46 (59.7%)		
Quality of life: Mental Component Summary (MCS)	Poor MCS (0-49)	144 (67.0%)	71 (33.0%)	8.23 (1)	0.004*
	Good MCS (50-100)	68 (51.5%)	64 (48.5%)		
Academic Performance (CGPA)	Poor (< 2.00)	2 (50.0%)	2 (50.0%)	18.091 (2)	<0.001**
	Average (2.00–2.99)	28 (39.4%)	43 (60.6%)		
	Good (3.00–4.00)	182 (66.9%)	90 (33.1%)		

**p<0.001, *p<0.05 significant, Chi-square test

There was a significant association between migraine, quality of life and academic performance.

4 DISCUSSION

- Migraine prevalence among healthcare students at UniKL RCMP was 38.9%, higher than that reported among medical students in Egypt (17.3%), indicating a substantial migraine burden in this students population (Ragab et al., 2023).
- Migraine was significantly associated with poorer physical component summary (PCS) and mental component summary (MCS), indicating reduced physical functioning and psychological well-being among affected students, consistent with previous findings (Ragab et al., 2023; Thiagarajan et al., 2022).
- A significant association between migraine and lower CGPA was observed, suggesting a potential adverse impact on academic performance (Osman Ali et al., 2022).
- Larger multicentre and longitudinal studies are recommended to confirm these associations and explore potential contributing factors such as stress, sleep quality, lifestyle and migraine severity.
- Intervention studies are also warranted to evaluate the effectiveness of migraine prevention and management strategies in improving students' quality of life and academic performance.

GOOD NEWS – Migraine can be managed. Early identification, healthy lifestyle and proper treatment can improve quality of life.
